

The internet takes you everywhere and tells you everything, so why travel or read at all?

The internet like a mass media informant, is liked or not, very useful. You can get useful informations very quickly, and you do not have to go anywhere. Many people say, that internet has done a lot of damage to young people, because, they do not go to the nature and read books and enjoy with nature... Many of them also say that internet has done a lot of damage, because of illegal copies...

I think that you have to be aware, that internet has not done nothing harmful to anyone. Of course there are many, whose way of life, free time and sometime love become internet. But if you know how to live and use internet properly you definitely profit.

To be travelling means, to get knowing new countries, places, natural wonders and also peoples and their way of living. That is something that internet can not bring to you through your home computer.

»Why read, when I can go surfing the net?«, is question of today's youth. I think reading is good, for human's mind. You learn many new words, you also speak more fluently, your wordage is nice...

But in my opinion, you learn more from internet and by that I do not think, you learn more mathematics and biology, but you practice your English, you learn how to use windows, internet and other programmes. And when you learn how to use programmes, you also learn how to learn programmes! That is the main factor of the internet in my opinion. No teacher teaches you better than internet itself, because you learn on your own! In nowadays there is no company, which has not computer. And if you know how to learn programmes, you can learn new programme very quick and easy.

I think that internet can make your life easier, I know that this sounds like commercial, but if you handle it, it really does. But does not mean that all the people will give up reading, I think that that may still change, because people did not give up sport activities, when the car was invented, or when it became cheaper.
